# Urban Forestry Recovery and Resiliency Identification, Ecology and Management Part II: Diseases

Amy Ramsey, Forest Pathologist WA Dept. of Natural Resources amy.ramsey@dnr.wa.gov

# Most tree diseases are caused by fungi.

# The disease triangle is integral for understanding tree diseases.

# Different diseases can affect different parts of the tree.

# Sometimes it's not so simple.

# Tree diseases may be working in concert with other disturbance agents.

# Steps to Diagnosis: (what are the clues?)

- Note damage and trees affected.
- Note signs and symptoms.
- Look for pattern to damage development.
- Look at the big picture over the site.
- Incorporate personal or local knowledge.

## Dwarf mistletoes are parasitic plants.

Prune infected branches early to reduce impacts Replace tree with less susceptible or resistant host

Foliar damage: Disease or something else?

- Note damage and trees affected.
- Note signs and symptoms.
- Look for pattern to damage development.
- Look at the big picture over the site.
- Incorporate personal or local knowledge.

# Look close. What are the clues?

## Pine Needle Casts

![](_page_14_Picture_2.jpeg)

Dothistroma
Lophodermella
Lophodermium

![](_page_15_Picture_1.jpeg)

![](_page_15_Picture_2.jpeg)

![](_page_15_Picture_3.jpeg)

![](_page_16_Picture_0.jpeg)

![](_page_16_Picture_1.jpeg)

![](_page_16_Picture_2.jpeg)

## Management strategies for foliar diseases

![](_page_17_Picture_1.jpeg)

- Fungicides can buy protection on a yearly application basis product and timing depend on pathogen (lifecycle, weather conditions)
- Prune or thin to keep airflow at a maximum if foliar issues occurring

![](_page_17_Picture_4.jpeg)

- If pruning, prune in late fall or winter to avoid other disease and insect issues
- Right tree in right place
  - avoid planting offsite species (offsite seed source or offsite species in wet or drainage areas)

![](_page_17_Picture_8.jpeg)

# Fall Flagging

![](_page_18_Picture_1.jpeg)

# Red Belt/Parch Blight

- Needles damaged uniform distance on tip.
- No fruiting bodies.
- Position that is exposed to dry or cold winds.

![](_page_19_Picture_4.jpeg)

![](_page_19_Picture_5.jpeg)

# Sometimes it's not so simple.

![](_page_20_Picture_1.jpeg)

# **The Most Common Root Diseases**

![](_page_21_Picture_1.jpeg)

![](_page_21_Picture_2.jpeg)

Armillaria root disease

Schweinitzii root disease

![](_page_21_Picture_5.jpeg)

![](_page_21_Picture_6.jpeg)

Laminated root rot

![](_page_21_Picture_8.jpeg)

Annosus root disease

#### Phytophthora root diseases

#### Root Diseases

## Fungi: multiple species Hosts: all species, conifers and hardwoods

![](_page_22_Picture_2.jpeg)

![](_page_22_Picture_3.jpeg)

![](_page_22_Picture_4.jpeg)

# Functions of Root Diseases:

- Compromise structural integrity of roots and base of tree
- Reduce growth
- Cause mortality
- Increase tree susceptibility to windthrow and insect damage

![](_page_23_Picture_5.jpeg)

![](_page_23_Picture_6.jpeg)

Root disease patches have trees in various stages of decline next to seemingly healthy trees.

- Snags
- Trees with no fine branches, no foliage
- Trees with fine branches, no foliage
- Trees with thinning foliage

![](_page_24_Picture_5.jpeg)

#### Other stand level symptoms may include:

- Trees with chlorotic foliage
- Trees with stress cone crops
- Trees with thinning foliage
- Rounded tops of crowns

![](_page_25_Picture_5.jpeg)

![](_page_25_Picture_6.jpeg)

![](_page_26_Picture_0.jpeg)

![](_page_27_Picture_0.jpeg)

Symptoms: "Basal resinosus" or excessive resin flow

![](_page_27_Picture_2.jpeg)

## Schweinitzii root disease

- Phaeolus schweinitzii
  - Velvet top fungus
- Old Douglas-fir & Sitka spruce, most common hosts

![](_page_28_Picture_4.jpeg)

![](_page_28_Picture_5.jpeg)

![](_page_29_Picture_0.jpeg)

![](_page_29_Picture_1.jpeg)

![](_page_29_Picture_2.jpeg)

![](_page_29_Picture_3.jpeg)

## Armillaria root disease

![](_page_30_Picture_1.jpeg)

![](_page_30_Picture_2.jpeg)

![](_page_30_Picture_3.jpeg)

![](_page_30_Picture_4.jpeg)

#### White mycelial fans

![](_page_31_Picture_1.jpeg)

### Basal resinosus

![](_page_31_Picture_3.jpeg)

![](_page_31_Picture_4.jpeg)

### Rhizomorphs

![](_page_31_Picture_6.jpeg)

![](_page_31_Picture_7.jpeg)

Laminated Root Rot Fungus: *Phellinus sulphurascens* (*Phellinus weirii*)

Host: most commonly Douglas-fir

![](_page_32_Picture_2.jpeg)

![](_page_32_Picture_3.jpeg)

![](_page_32_Picture_4.jpeg)

![](_page_33_Picture_0.jpeg)

#### Ecotrophic mycelium

![](_page_33_Picture_2.jpeg)

#### Setal hyphae, red whiskers

![](_page_33_Picture_4.jpeg)

#### **Annosus Root Disease**

Fungi: Heterobasidion occidentale Heterobasidion parviporum (Heterobasidion annosum)

#### Hosts:

Abies Juniperus Libocedrus Pinus Pseudotsuga Sequoiadendron Tsuga

![](_page_34_Picture_4.jpeg)

![](_page_34_Picture_5.jpeg)

# Stump staining White decay with black flecks Hollow stumps

![](_page_35_Picture_1.jpeg)

![](_page_35_Picture_2.jpeg)

![](_page_35_Picture_3.jpeg)

![](_page_35_Picture_4.jpeg)

### Phytophthora's as root diseases

![](_page_36_Picture_1.jpeg)

Host: Port Orford Cedar (*Chamaecyparis lawsoniana*) Fungus: *Phytophthora lateralis* 

#### General management recommendations for root diseases

#### Right tree in the right place

![](_page_37_Picture_2.jpeg)

Avoid damaging roots or stem of tree:

- soil compaction
- construction damage
- landscaping equipment damage
   severing roots

![](_page_37_Picture_7.jpeg)

![](_page_37_Picture_8.jpeg)

![](_page_37_Picture_9.jpeg)

- Root disease centers are <u>usually</u> localized.
- All sizes of susceptible trees can be affected.

![](_page_38_Picture_2.jpeg)

#### General management recommendations for root diseases

- Alternative species:
   plant or encourage
   least susceptible
   species
  - Match seed zone of stock to site
  - Expect some mortality unless planting completely resistant or immune species

![](_page_39_Picture_4.jpeg)

# Heart rots and stem decays

![](_page_40_Picture_1.jpeg)

![](_page_40_Picture_2.jpeg)

Bark removal allows decay fungi to enter the tree and cause decay.

![](_page_41_Picture_1.jpeg)

![](_page_41_Picture_2.jpeg)

![](_page_41_Picture_3.jpeg)

# *Phellinus (Porodaedalea) pini* usually affects older trees.

![](_page_42_Picture_1.jpeg)

# Heart rots and stem decay management strategies.

- Always depends on objectives
  - wildlife
  - merchantable wood
  - safety
- Prune when branches are small so wounds seal quickly
- Minimize damage to trees

![](_page_43_Picture_7.jpeg)

![](_page_43_Picture_8.jpeg)

## General Tree Disease Management Recommendations

-Right tree in the right site
-water
-sunlight
-growing space

![](_page_44_Picture_2.jpeg)

-Generally greater stress on trees moving forward - consider species -more water needed -less water available -Develop vegetation management plants for moving forward -Individual trees -Urban forests -Green belts

![](_page_44_Picture_5.jpeg)

### Conclusions

![](_page_45_Picture_1.jpeg)

- Lot's of biotic and abiotic tree damaging agents
   Know the common ones and know where to report the unusual
  - -Get help with identification if unsure
  - -Get help with agent specific management options
- Overall tree stress is likely to increase with warmer, drier conditions
- -Likely increase in root disease damage
   Expect the unexpected moving forward

![](_page_45_Picture_7.jpeg)

# **Contacts and Additional Information**

#### CONTACTS AND RESOURCES FOR TREE INSECT AND PATHOGEN TECHNICAL ASSISTANCE: Washington and Oregon

#### Washington Resources for Forest Insect and Disease Information (non-federal lands):

DNR - Resource Protection Division, PO Box 47037, Olympia, WA 98504-7037 Dan Omdal, Forest Pathologist (360) 902-1692 Amy Ramsey, Forest Pathologist (360) 902-1309 Glenn Kohler, Forest Entomologist (360) 902-1342 Melissa fischer, Forest Entomologist, Colville (509) 684-7474

#### Oregon Resources for Forest Insect and Disease Information (non-federal lands):

ODF – Forest Health, 2600 State Street, Sale	m, OR 97310-0340	
Alan Kanaskie, Forest Pathologist	(503) 945-7397	alan.kanaskie@oregon.gov

Mount Hood National Forest, 16400 Champion Way, Sandy, OR 97055 Kristen Chadwick, Forest Pathologist (503) 668-1474 klchadwick@fs.fed.us Holly Kearns, Forest Pathologist (503) 668-1477 hkearns@fs.fed.us Beth Willhite, Forest Entomologist (503) 668-1477

#### Washington State University (WSU) Plant Pest Diagnostic Services

WSU operates two Plant Pest Diagnostic Clinics, in Puyallup and in Pullman. The Puyallup Clinic generally handles samples from western Washington, while samples from eastern Washington are usually submitted to Pullman. Both Clinics offer diagnosis of plant diseases and disorders, insect and arthropod identification, and plant/weed identification. Identifications and diagnoses are accompanied by management recommendations when appropriate. Services provided by the WSU diagnosticians are fee-based. The WSU Clinics are able to process samples from Washington State, but not from other areas of the country. http://plantpath.wsu.edu/diagnostics/ (509) 335-3292 plant.clinic@wsu.edu

#### More in depth presentations about tree diseases and abiotic issues: http://forestry.wsu.edu/fsu/

![](_page_46_Picture_16.jpeg)

With changing climatic conditions, secondary pathogens and associated damage may become more common, with drought as a primary driver.

![](_page_47_Picture_1.jpeg)

#### Cytospora canker

Fungus: Cystospora spp.

Hosts: maple, spruce, willow, hemlock, poplar, cherry, Douglasfir, true fir, pear, mulberry, walnut, peach, larch, sycamore and many others

![](_page_48_Picture_3.jpeg)

![](_page_48_Picture_4.jpeg)

#### Nectria canker and twig dieback

#### Fungus: Nectria galligena

Hosts: may occur on over 60 species of trees and shrubs including apple, ash, birch, dogwood, elm, sweet gum, holly, maple, pear and walnut
